New page: Tracking Page

Low-Fi draft 1:

Low-Fi draft 2:

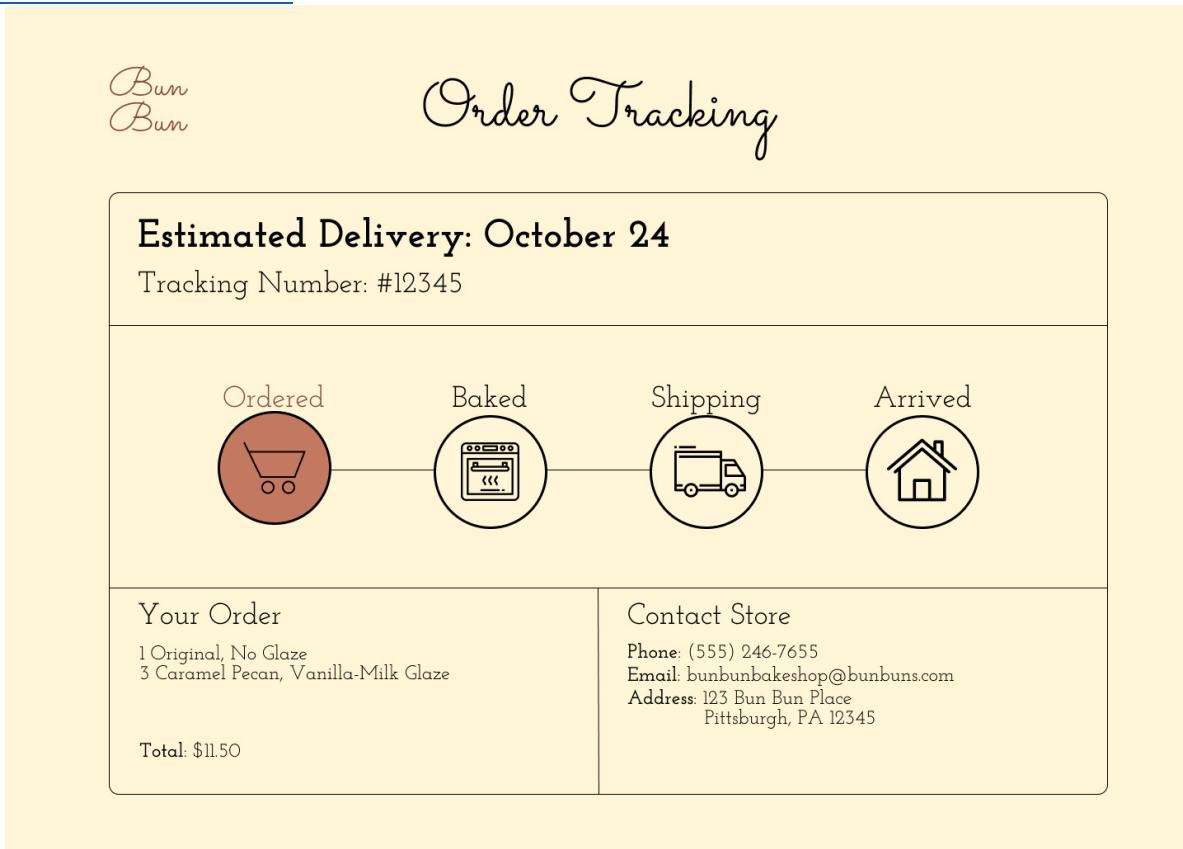

For the tracking page, I knew I wanted to include a progress bar with icons to show where in the shipping process the order was. To fill out the rest of the page, I looked at other websites' tracking pages for inspiration. I saw that other websites emphasized the estimated delivery date and tracking number, so I also prioritized those and put them right at the top. I also felt it was important for the order details to be included so that the user knew exactly what was being made and shipped, and I wanted to include the bakery contact information as well in case the user had questions or issues with their order.

In my first draft, I had a large container for the order details on the right because I wanted to clearly show what the user had ordered, but I changed it for my second draft because it forced the progress bar into a space that was too narrow, and I didn't think the order details were such important information on this particular page that it needed to take up half the space. I wanted to prioritize the actual tracking progress, since this is the order tracking page. Therefore, in my second draft, I put the order details at the bottom next to the contact information so that the progress bar could take up the entire horizontal space of the page. This allowed the order details to be accessible but not be as much of a priority on the page. Not only did it look better, but it also allowed the progress bar to be the most salient and accessible information, as it should be when considering the real purpose of this page.

High-Fi:

For my high-fi page, I used the same fonts and color scheme as the rest of the website, for consistency. I chose to use the accent color on the parts of the progress bar that were completed to show the user where in the process their order was. I felt this was a good way to tie the page to the rest of the website and quickly give the user salient, visual information about the status of their order.
